The **MODEL-med® Charlie and Charlie's Mum Obstetric Examination Simulator** is designed specifically for medical practitioners to assess cervical dilatation and fetal presentation. The user simply places the cervix over Charlie's head and then stretches it until the desired dilatation is achieved.

The MODEL-med® Charlie and Charlie's Mum Obstetric Examination Simulator comes with three cervixes, which are, from left to right, primipara, oedematous and multipara.

After lubricating the cervix with a water-based surgical lubricant the head can then be inserted into the opening at the back of the model. Using this method, the user can have any fetal presentation and cervical dilatation they wish.
