Parameters

Quantitative unit

ks

The model consists of three individual parts on a common stand that represent sections of the human skin with a magnification of 80×. Anatomical differences of the skin sections are didactically represented in an understandable manner.

- Microanatomical representation of the papillary layer (e.g. localised in the palm of the hand)
- Microanatomical representation of the reticular layer (e.g. localised at the back of the hand)
- Longitudinal section through the human scalp with hair follicle and root sheath.

All layers making up the skin and microscopic structures such as nerve, vessels and tactile corpuscles have been accurately and spatially realised on the models.
