This self-adhesive wound represents a venous leg ulcer, a substance defect in the tissue of the lower leg as a result of a chronic venous insufficiency. The shown exudation phase represents the most common ulcer disease (60% to 80% of all ulcer diseases) in its untreated condition. Fibrin and excessive wound exsudate have to be removed during the wound cleaning. This large wound is perfect for adhering at the lower leg and adheres by itself. For longer use, it can be fixed with a special skin glue. All materials used in this product are dermatologically harmless.
